

Benefits of a Kerrimuir[®] Tank

Kerrimuir is committed to excellence in rainwater tank design, manufacture and service. We are equally confident that this second generation Kerrimuir, hence K-2 will service your water storage needs faultlessly well into the future.

The unique rounded off design between the drums eliminates problems of cracking or splitting from expansion of tank body when filling with water. This is something we have learned from observation and discussions with people in the rainwater tank industry. The Kerrimuir Rainwater Products brand name and reputation is too important to us to deal with products that may have potential problems in the future.

So we have invested well into the excellence you see. Product evolution is costly but necessary. We have set a benchmark in how tank manufacturing should be. We confidently show you pictures of the tank from every angle so that you can be assured of the finishing, strength and robustness of the tank.

Our stringent processes, best practices and procedures ensure manufacturing is done to meet exacting standards for consistent quality and reliability. As such we can confidently provide a 15 year guarantee. See our Warranty Policy

All our tanks are manufactured to the requirements set out in Standards Australia Rainwater Tank Design and Installation Handbook HB 230-2006 and complies with Australian Standard AS 2070 and AS/NZS 4766.

What extra value do you obtain from a Kerrimuir?

You can easily add more Kerrimuir tanks according to your needs. They are designed to link to whatever capacity you require. You may decide today your garden is your priority and in a few months, you want to use rainwater to flush your toilets or wash your clothes. You can easily pick up another Kerrimuir 2600 litre to give you the extra capacity you are looking for. It has never been easier to harvest enough water for your every need.

State-of-the-art contemporary design that fits seamlessly into most Australian homes. It will not look out of place or need some corner to be hidden away. The K-2 may have been computer designed in engineering terms but it worked within the parameters of Kerrimuir Rainwater Products' unique contemporary design criteria.

Space saving design. The relatively small footprint in relation to the large capacity of the K-2 is something we at Kerrimuir Rainwater Products focused on. We realize that land in most homes now are smaller than ever and the only place for water tanks is the utility side of the house, where the central heating and hot water service is. To place a big round tank in your expensive and precious land till the end of time was not something our customers were looking for. The grassy green garden is for kids and entertainment space, not a big plastic rainwater tank.

Working for you. Once your K-2 rainwater tank is installed, it will immediately go to work for you, reducing the households' dependence on mains water for non-drinking purposes. Whichever way you choose to connect Kerrimuir, it will always help you harvest rainwater and help reduce your water bills.

If you choose to collect the maximum rebate on rainwater tanks by connecting to your laundry and toilet, you will require 5000 litres and above. You can achieve this by having two K-2's interconnected. This will give you the maximum Victorian Government Rebate of \$1,000.00.

Our innovative standard inlet and outlet designs allow you to connect the K-2 to just about any first flush diverters, rain heads, leaf strainers and filters, Australian Water Mark certified mains/rainwater interchange devices and pumps. Connection is really as easy as 123.

Optimum performance. K-2 retains its signature design of 5 ribs on each drum--enhancing lateral strength. Its weight in relation to capacity makes it a high performance tank. Kerrimuir is ever ready to accept any challenge on rainwater design supremacy.

Cleanliness. Even with first flush diverters and filtration, sediment and other material will get into your tank. Settling at the anaerobic zone—the lowest parts of your tank. We give you the option to open all 3 inlets for extra collection of water from your roof and ease of cleaning – recommended every 2 years by most authorities. All you will require is a pressure cleaner, a long mop and a submersible pump. We can also arrange tank cleaning for you should you require that service.

Water smart. Caring for the environment is something we are Kerrimuir Rainwater Products take seriously. You will have a partner that understands great products equals to great results. It simply means we will continually always strive to better ourselves as a company and corporate citizen of the world—designing, building and dealing with green products that will benefit all Australians.
